1.INTRODUCTION:

1.1 Project Overview:

Data analytics refers to the process and practice of analysing data to answer questions, extract insights, and identify trends. This term also includes the way of how this data is gathered, cleaned and summarized for use and finally the processing of data to support data analytics and predictive modelling.

Recent Covid-19 Pandemic has raised alarms over one of the most overlooked areas to focus: Healthcare Management. While healthcare management has various use cases for using data science, patient length of stay is one critical parameter to observe and predict if one wants to improve the efficiency of the healthcare management in a hospital.

This parameter helps hospitals to identify patients of high LOS-risk (patients who will stay longer) at the time of admission. Once identified, patients with high LOS risk can have their treatment plan optimized to minimize LOS and lower the chance of staff/visitor infection. Also, prior knowledge of LOS can aid in logistics such as room and bed allocation planning.

The goal is to accurately predict the Length of Stay for each patient on case by case basis so that the Hospitals can use this information for optimal resource allocation and better functioning. The length of stay is divided into 11 different classes ranging from 0-10 days to more than 100 days.

1.2 PURPOSE:

There are many reasons why healthcare professionals might want to predict the length of stay of their patients. For example, if a hospital is trying to forecast how many beds will be needed in the coming days or weeks, they will need to know how long their patients are likely to stay. The purpose of predicting the length of stay of the patients is to estimate the amount of time that a patient will spend in a hospital. This information improves bed turnover, allowing hospitals to match demand with capacity for elective and emergent admissions, intensive care unit (ICU) care, and interhospital transfers. Length of Stay(LOS) is also an

important metric for quality of care, so knowing how to predict it can help healthcare professionals identify areas where they can improve.

2. LITERATURE SURVEY:

2.1 Existing Problem:

There is an error in the existing prediction of length of stay in the hospital. The error is that the length of stay is being predicted as shorter than it actually is. This approximate prediction is causing problems for patients who are planning their hospital stay and for the hospital staff who are trying to allocate resources for the patients.

2.2 Reference:

- Janice Hammond, 2015.
- LexisNexis, 2015.
- Title : Predicting Length of Stay Across Hospital Departments
Author : Jesus Manuel Puentes Gutierrez.

2.3 Problem Statement Definition:

To understand your customer's point of view create a problem statement. The Customer Problem Statement template helps you focus on what matters to create experiences people will love.

A well-articulated customer problem statement allows you and your team to find the ideal solution for the challenges your customers face. Throughout the process, you'll also be able to empathize with your customers, which helps you better understand how they perceive your product or service.

Customer Problem Statement for Hospitals' Health-Care data:

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	a patient	get admitted to the hospital	there is not enough availability of beds	the number of patients is more than the bed available	anxious that I might not get cured
PS-2	a nurse	Allocate resources to the patient	there is not enough available	sufficient resources have not been allocated to the hospital	scared that the patient will not get the right treatment

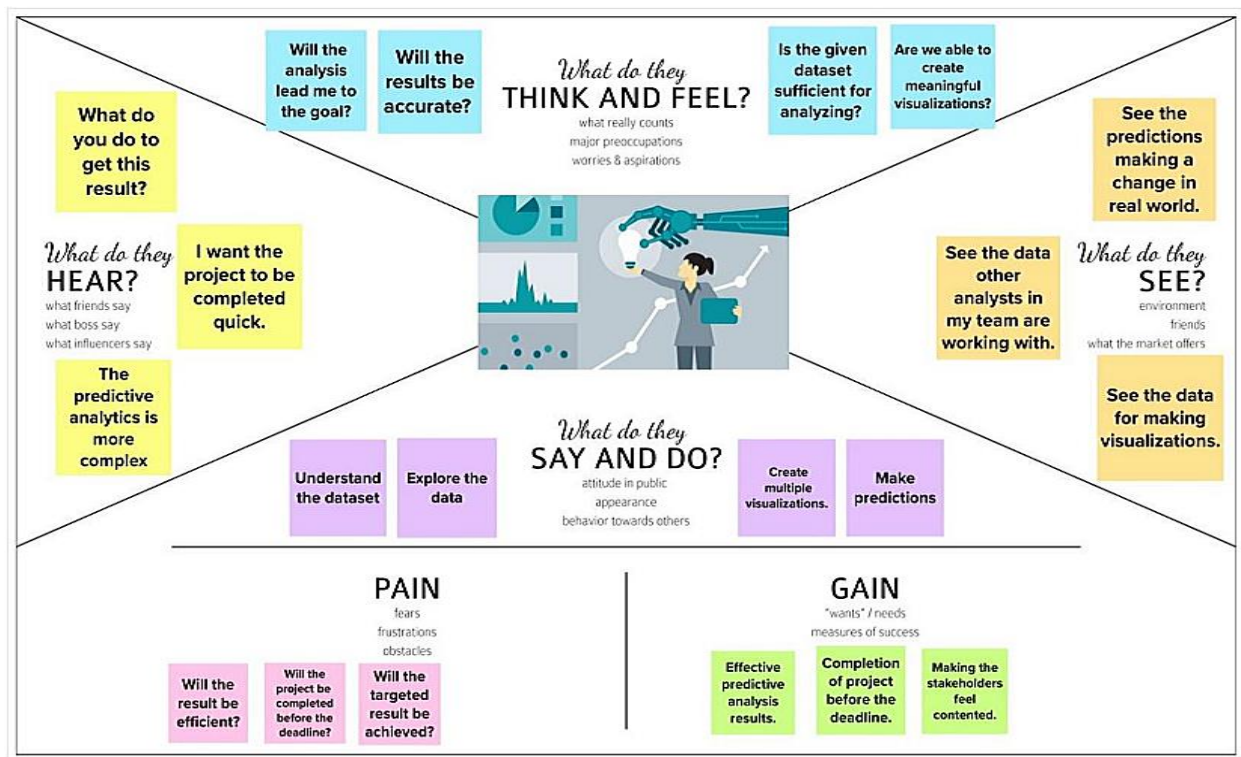

3. IDEATION & PROPOSED SOLUTION:

3.1 Empathy Map Canvas:

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviors and attitudes. It is a useful tool to help teams better understand their users.

Creating an effective solution requires understanding the true problem and the person who is experiencing it. The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

Empathy map for Predicting Length of Stay (LOS):

3.2 Ideation & Brainstorming:

Brainstorming provides a free and open environment that encourages everyone within a team to participate in the creative thinking process that leads to problem solving. Prioritizing volume over value, out-of-the-box ideas are welcome and built upon, and all participants are encouraged to collaborate, helping each other develop a rich amount of creative solutions.

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

This is used to work as a team to present the ideas of each and every person. In the Analytics for hospitals health-care data project, this brainstorming session helped in getting different possible ideas from the point-of-view of every actor involved in the hospitals health-care system.

Template

Brainstorm & idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

- 10 minutes to prepare
- 1 hour to collaborate
- 2-8 people recommended

➔

Before you collaborate

A little bit of preparation goes a long way with this session. Here's what you need to do to get going.

10 minutes

A

Team gathering

Define who should participate in the session and send an invite. Share relevant information or pre-work ahead.

B

Set the goal

Think about the problem you'll be focusing on solving in the brainstorming session.

C

Learn how to use the facilitation tools

Use the Facilitation Superpowers to run a happy and productive session.

[Open article](#) ➔

1

Define your problem statement

What problem are you trying to solve? Frame your problem as a How Might We statement. This will be the focus of your brainstorm.

5 minutes

PROBLEM

How might we predict the Length of the Stay (LOS) for each patient?

Key rules of brainstorming

To run a smooth and productive session

- Stay in topic.
- Encourage wild ideas.
- Defer judgment.
- Listen to others.
- Go for volume.
- If possible, be visual.

Share feedback

Need some inspiration?

See a finished version of this template to refresh your work.

[Open example](#) ➔

Step-2: Brainstorm, Idea Listing and Grouping

2

Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

TP

You can select a sticky note and hit the pencil (switch to sketch) icon to start drawing!

Deepika

Step-3: Idea Prioritization

4

Prioritize

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

20 minutes

→

After you collaborate

You can export the mural as an image or pdf to share with members of your company who might find it helpful.

Quick add-ons

- A Share the mural**
Share a view link to the mural with stakeholders to keep them in the loop about the outcomes of the session.
- B Export the mural**
Export a copy of the mural as a PNG or PDF to attach to emails, include in slides, or save in your drive.

Keep moving forward

- Strategy blueprint**
Define the components of a new idea or strategy.
[Open the template →](#)
- Customer experience journey map**
Understand customer needs, motivations, and obstacles for an experience.
[Open the template →](#)
- Strengths, weaknesses, opportunities & threats**
Identify strengths, weaknesses, opportunities, and threats (SWOT) to develop a plan.

3.3 Proposed Solution

S. No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	To predict the Length of Stay (LOS) for each patient for the allocation of beds and resources.
2.	Idea / Solution description	Predicting the Length of stay by the patients' severity of illness, Age and allocating the beds and resources by using Data visualization tools.
3.	Novelty / Uniqueness	The traditional method's way of allocation of beds and resources by prediction of LOS are approximate and it might lead to insufficient resources. By our proposed solution with analysis of historical data we could predict a more accurate LOS.
4.	Social Impact / Customer Satisfaction	The prediction of a more accurate Length of Stay will result in the allocation of sufficient beds and resources for each patient that helps in their recovery.
5.	Business Model (Revenue Model)	The right Length of Stay prediction could help in allocation of only enough beds and resources and not more than enough. This would lessen the money both the hospital and the patient spent.

6.	Scalability of the Solution	This advanced prediction method instead of the traditional methods makes the Hospital function better by more accurate allocation of beds and resources because it uses the historical data to analyse using visualization tools.
----	-----------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

3.4 Problem Solution fit:

Define CS, fit into CC	1. CUSTOMER SEGMENT(S) Who is your customer? i.e. working parents of 0-5 y.o. kids CS Patients in a hospital who needs to get admitted for a period of time	6. CUSTOMER CONSTRAINTS What constraints prevent your customers from taking action or limit their choices of solutions? i.e. spending power, budget, no cash, network connection, available devices. C budget, emergency situations, no cash	5. AVAILABLE SOLUTIONS Which solutions are available to the customers when they face the problem? AS or need to get the job done? What have they tried in the past? What pros & cons do these solutions have? i.e. pen and paper is an Approximate prediction of the Length of stay. Pros: Allocation of beds and resources in some amount Cons: The prediction is not accurate leading to lack of resources	Explore AS, differentiate
	2. JOBS-TO-BE-DONE / PROBLEMS Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one; explore different sides. J Length of stay of each patient needs to be predicted for the right allocation of beds and resources	9. PROBLEM ROOT CAUSE What is the real reason that this problem exists? What is the back story behind the problem? RC Predicting the Length of stay approximately leads to this	7. BEHAVIOUR What does your customer do to address the problem and get the job done? BE i.e. directly related: find the right solar panel installer, calculate usage and benefits; indirectly associated: customers spend free time on volunteering Check where the resources are available, ask the administration to provide beds	
Focus on J&P, tap into BE, understand RC				Focus on J&P, tap into BE, understand RC

Identify strong TR & EM	3. TRIGGERS What triggers customers to act? i.e. seeing their neighbor installing solar panels, reading about a more efficient solution in the news. TR Knowing about other hospitals allocating resources and beds more efficiently	10. YOUR SOLUTION If you are working on an existing business, write down your current solution first, fill in the canvas, and check how much it fits reality. If you are working on a new business proposition, then keep it blank until you fill in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer behavior. SL Prediction of Length of stay with their age, severity of illness using historical data so that the prediction would be more accurate and the allocation of beds and resources would be better.	8. CHANNELS of BEHAVIOUR 8.1 ONLINE What kind of actions do customers take online? Extract online channels from #7 8.2 OFFLINE What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development. CH Online: find where the necessary resources are available Offline: check if there are any better hospitals that could provide them bed	Identify strong TR & EM
	4. EMOTIONS: BEFORE / AFTER How do customers feel when they face a problem or a job and afterwards? i.e. lost, insecure -> confident, in control - use it in your communication strategy & design. EM Before: scared, no confidence, weak After: happy, more confident, relieved.			

4.REQUIREMENT ANALYSIS:

4.1 Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through Gmail
FR-2	User Confirmation	Confirmation via gmail
FR-3	User Login	Login through Gmail
FR-4	Uploading the data	Uploading into the IBM Cognos analytics
FR-5	Preparing the data	Data module creation
FR-6	Exploring the data	Performing predictive analysis
FR-7	Visualizing the data	Creating dashboards

4.2 Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	The Dashboards are created using cognos analytics to display the results of predictive analysis on a patient's LOS that could be used for easy understanding.

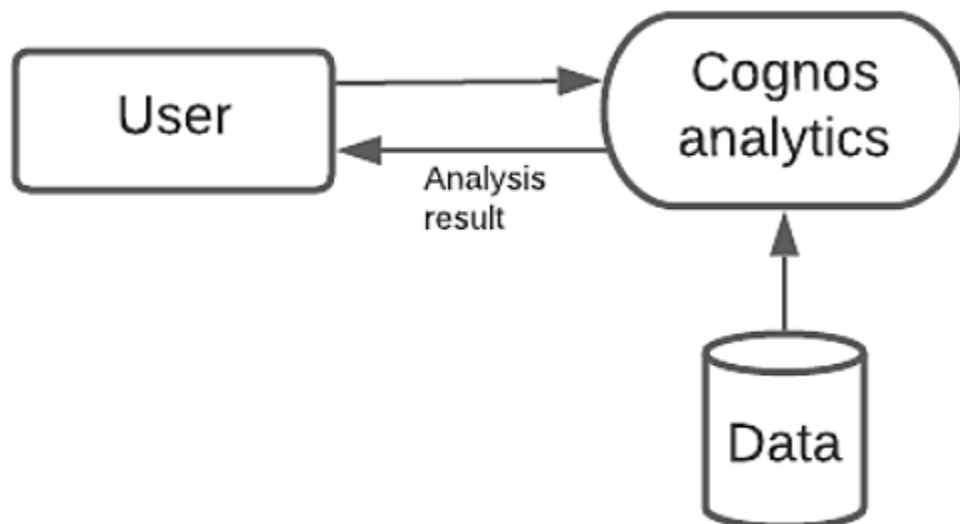

NFR-2	Security	The application helps in preventing unauthorized access.
NFR-3	Reliability	The results will be reliable to the users and always consistent.
NFR-4	Performance	The analysis results are fast to get. Visualizations are made in less time usually seconds
NFR-5	Availability	The dashboards can be available always when there is a demand
NFR-6	Scalability	The application can perform analysis and create visualizations on any patient's data.

5. PROJECT DESIGN:

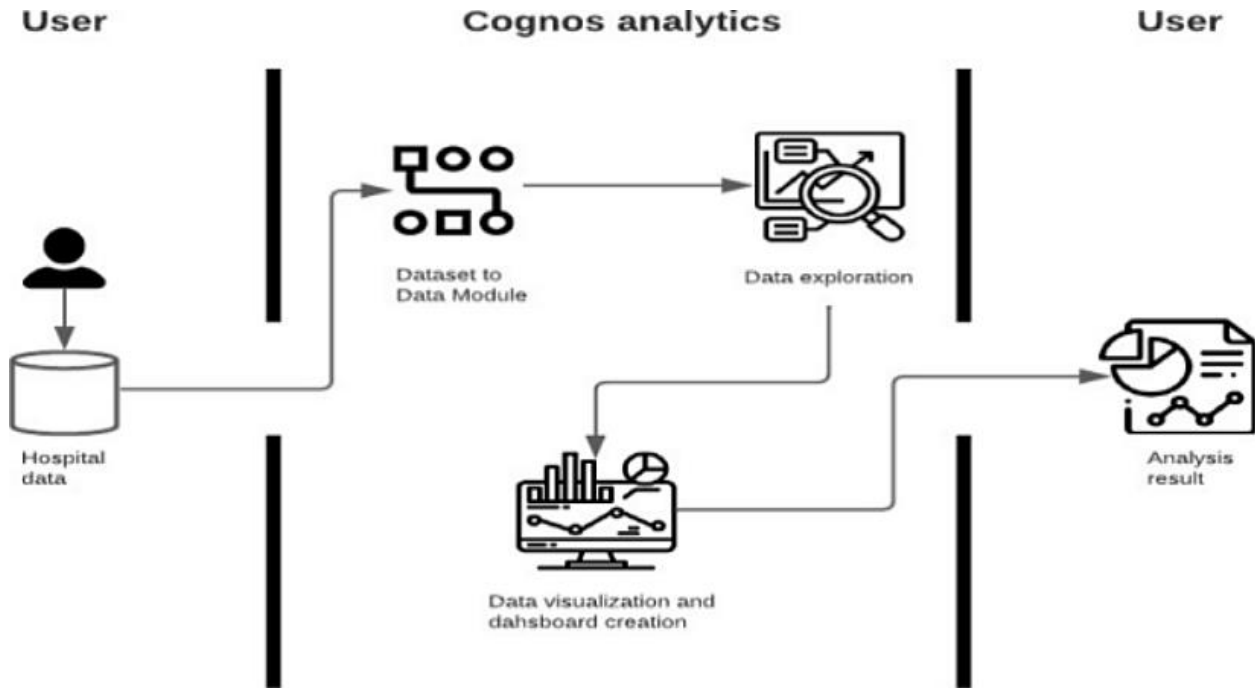

5.1 Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

Data flow diagram level 0:

5.2 Solution & Technical Architecture:

5.3 User Stories:

The below template list all the user stories for the product.

User Type	Functional Requirement(Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
User (Data analyst)	Registration	USN-1	As a user, I can register for the Cognos analytics account by entering my gmail, password, and confirming my password.	I can access my account / dashboard	High	Sprint-1
		USN-2	As a user, I will receive confirmation gmail once I have registered for the	I can receive confirmation email & click confirm	High	Sprint-1

			application			
	Login	USN-3	As a user, I can log into the application by entering gmail & password	I can receive confirmation gmail & click confirm	High	Sprint-1
	Application dashboard	USN-4	Uploading the data through the quick launch	The data gets uploaded	High	Sprint-1
		USN-5	Uploading the data through the hamburger menu	The data gets uploaded	High	Sprint-1
		USN-6	Preparing the data by creating a data module	The data gets cleaned.	High	Sprint-2
		USN-7	Exploration of data for the prediction of LOS Data visualization with the creation of dashboards	The data is analysed	High	Sprint-3
		USN-8		The data is presented	High	Sprint-4

6.PROJECT PLANNING & SCHEDULING:

6.1 Sprint Planning & Estimation:

The below template shows the Sprint Planning & Estimation:

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
--------	-------------------------------	-------------------	-------------------	--------------	----------	--------------

Sprint-1	Registration	USN-1	As a user, I can register for the cognos analytics application by entering my email, password, and confirming my password.	1 0	High	Deepika Samyukthasri Dharshini Arivazhagi
Sprint-1	Data uploading	USN-2	As a user, I will be uploading my data into thecognos analytics	1 0	High	Deepika Samyukthasri Dharshini Arivazhagi
Sprint-2	Data preparation	USN-3	As a user, I will be cleaning the data for analysis and creating a data module	5	High	Deepika Samyukthasri
Sprint-2	Data Analysis	USN-4	As a user, I will be performing analysis on the data for making predictions	5	High	Deepika Samyukthasri
Sprint-2	Dashboards	USN-5	As a user, I will be making visualizations andinteractive dashboards from the data	1 0	High	Deepika Samyukthasri
Sprint-3	Story	USN-6	As a user, I will be making stories from the dataand the dashboards	2 0	High	Deepika Samyukthasri
Sprint-4	Report	USN-7	As a user, I will be making a report from the analysis and dashboards	2 0	High	Deepika Samyukthasri

6.2 Sprint Delivery schedule:

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	20	6 Days	24 Oct 2022	29 Oct 2022	20	29 Oct 2022
Sprint-2	20	6 Days	31 Oct 2022	05 Nov 2022	20	05 Nov 2022
Sprint-3	20	6 Days	07 Nov 2022	12 Nov 2022	20	12 Nov 2022
Sprint-4	20	6 Days	14 Nov 2022	19 Nov 2022	20	19 Nov 2022

Velocity:

Imagine we have a 10-day sprint duration, and the velocity of the team is 20 (points per sprint). Let's calculate the team's average velocity (AV) per iteration unit (story points per day).

$$AV = \frac{\text{sprint duration}}{\text{velocity}} = \frac{20}{10} = 2$$

6.3 Reports from JIRA:

Burndown Chart:

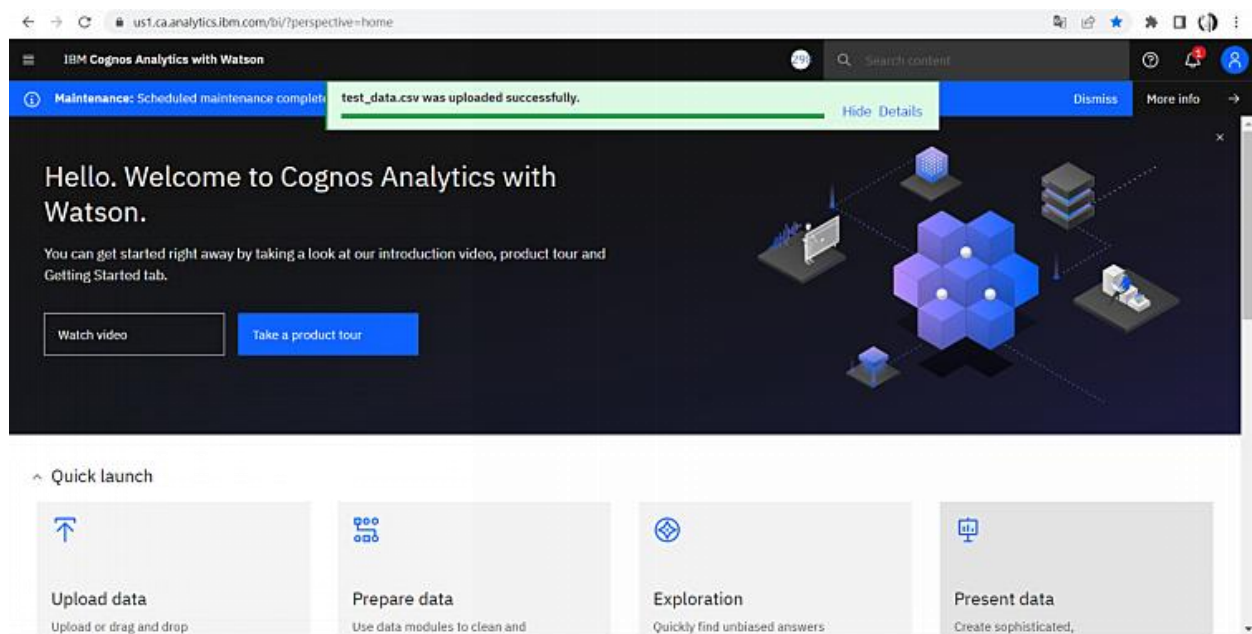

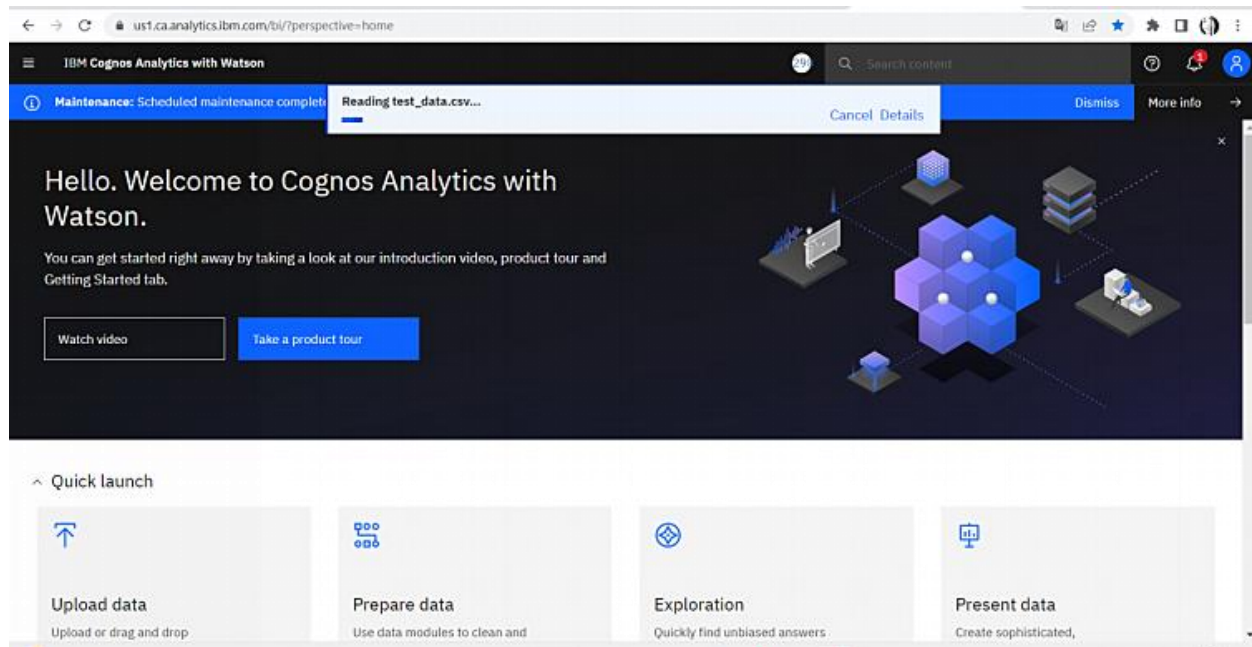

A burn down chart is a graphical representation of work left to do versus time. It is often used in agile software development methodologies such as Scrum. However, burn down charts can be applied to any project containing measurable progress over time.

7. CODING & SOLUTIONING:

7.1 Feature 1:

- Uploading the data in the IBM cognos analytics.

- Creating the data module.

Uploading the dataset:

The image displays two sequential screenshots of the IBM Cognos Analytics web application interface, illustrating the process of uploading a dataset.

Top Screenshot: The browser address bar shows the URL `us1.ca.analytics.ibm.com/oi7/perspective-home`. The main header includes the text "IBM Cognos Analytics with Watson" and a search bar. A notification bar at the top indicates "Maintenance: Scheduled maintenance complete" and "Reading test_data.csv...". The main content area features a welcome message: "Hello. Welcome to Cognos Analytics with Watson." Below this, it says "You can get started right away by taking a look at our introduction video, product tour and Getting Started lab." There are two buttons: "Watch video" and "Take a product tour". To the right, there is a diagram showing a central cluster of blue cubes connected to various data sources and processing units.

Bottom Screenshot: The same interface is shown, but the notification bar now displays a green message: "test_data.csv was uploaded successfully." The "Reading test_data.csv..." message is no longer present. The rest of the interface, including the welcome message and the "Quick launch" section, remains the same.

Quick launch section: Below the main content area, there is a "Quick launch" section with four tiles:

- Upload data:** Upload or drag and drop
- Prepare data:** Use data modules to clean and
- Exploration:** Quickly find unbiased answers
- Present data:** Create sophisticated,

9.RESULTS:

9.1 Performance Metrics:

S.No.	Parameter	Screenshot / Values
1.	Dashboard design	<p>No of Visualizations / Graphs – Fourteen visualizations were created using Cognos Analytics</p>  <p>The screenshot displays a dashboard with four visualizations:</p> <ul style="list-style-type: none"> Severity of illness by number of cases: A donut chart showing the distribution of illness severity. The total count is 137,057. The chart is divided into three segments: Moderate (purple), Major (orange), and Extreme (blue). Department-wise, Age-wise number of cases: A horizontal stacked bar chart showing the number of cases across different departments (TB & Chest disease, anesthesia, radiotherapy, surgery, gynecology) and age groups (0, 2K, 4K, 6K, 8K, 10K, 12K, 14K, 16K, 18K, 20K, 22K, 24K, 26K, 28K). Department wise number of Patients: A vertical bar chart showing the number of patients across different departments (TB & Chest disease, anesthesia, gynecology, radiotherapy, surgery) and a Sum. The y-axis represents the Number of Patients (0 to 200K). Availability of Extra rooms: A pie chart showing the availability of extra rooms in the hospital. The chart is divided into segments representing different room counts (25, 20, 15, 12, 10, 8, 6, 4, 3, 2, 1).
2.	Data Responsiveness	The visualizations can be created from the data in a fast and easy manner.

10.ADVANTAGES & DISADVANTAGES:

Advantages:

- Allows for better resource planning.
- Can help identify patients at-risk.
- Allows for earlier interventions .
- Reduces the hospital expenditures.
- No excess usage of resources from hospitals.

Disadvantage:

- The result might be less accurate sometimes.
- It may lead to over or under-treatment.

11.CONCLUSION:

This project shows that reductions in hospital costs and an improvement in quality patient care are possible. We prove that estimating the length of stay is possible at the hospital level. This means that it is possible to assess which departments are a better choice to save costs. The improvement in the success rates when predicting the LOS in some hospital departments is interesting. This helps avoid unnecessary effort and provides a contextualised vision to hospitals about which departments are susceptible to cost and resource-saving options. Also, it would be interesting to analyse the length of stay after suffering a big pandemic as COVID-19 to check how it affects to this feature (LOS) and to find out how this fact affects to hospital departments.

12.FUTURE SCOPE:

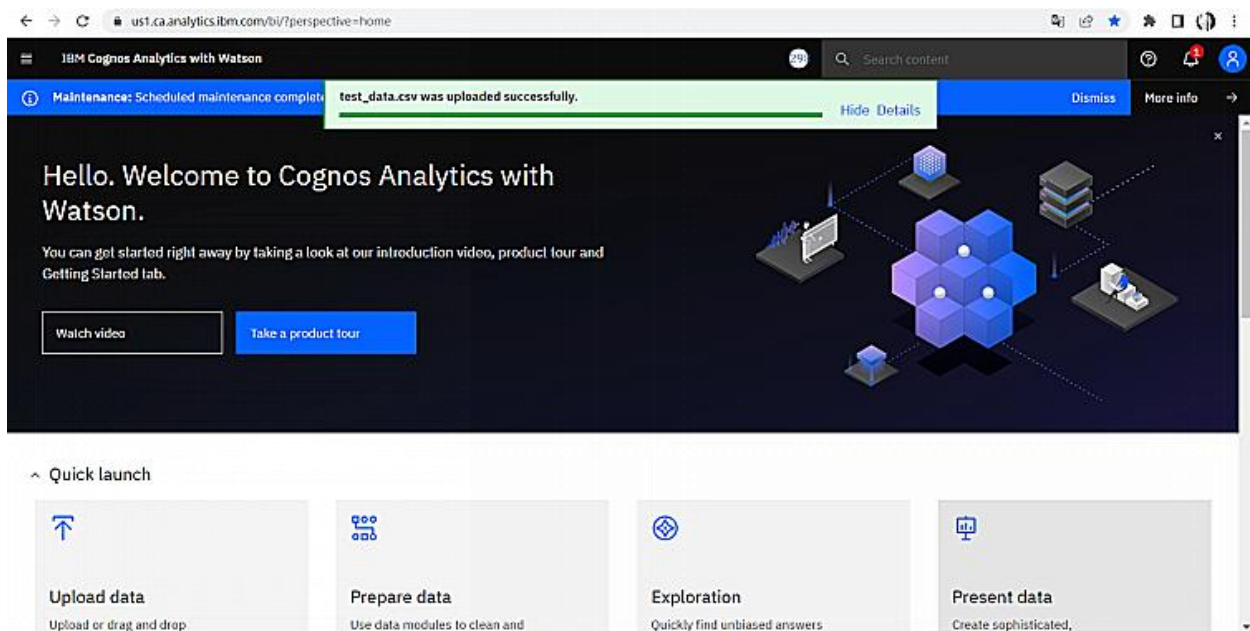

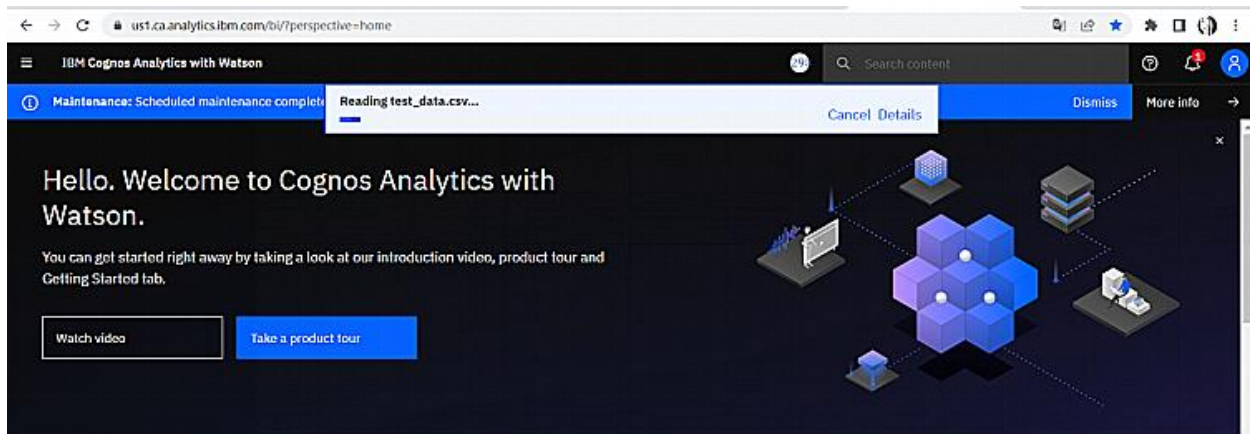

The future scope of data analytics is very promising. With the advent of new technologies and the increasing demand for data-driven decision making, organization will require more sophisticated data analytics tools and

techniques. Our analysis also offers directions to future research in those hospital departments which are the most appropriate ones to predict LOS.

Story:

Predicting the Length of the stay of the Patients

- The goal is to accurately predict the Length of Stay for each patient on case by case basis.
- The Hospitals can use this information for optimal resource allocation and better functioning.
- The length of stay is divided into 11 different classes ranging from 0-10 days to more than 100 days.

Number of patients by their age and illness range

Number of Patients by Age and Severity of illness

This column chart shows the number of patients getting admitted to the hospital classified based on their age and severity of illness.

The hierarchy bubble shows the bed grade with number of Patients admitted in a department, ward-wise.

Length of stay of Patients by their illness range

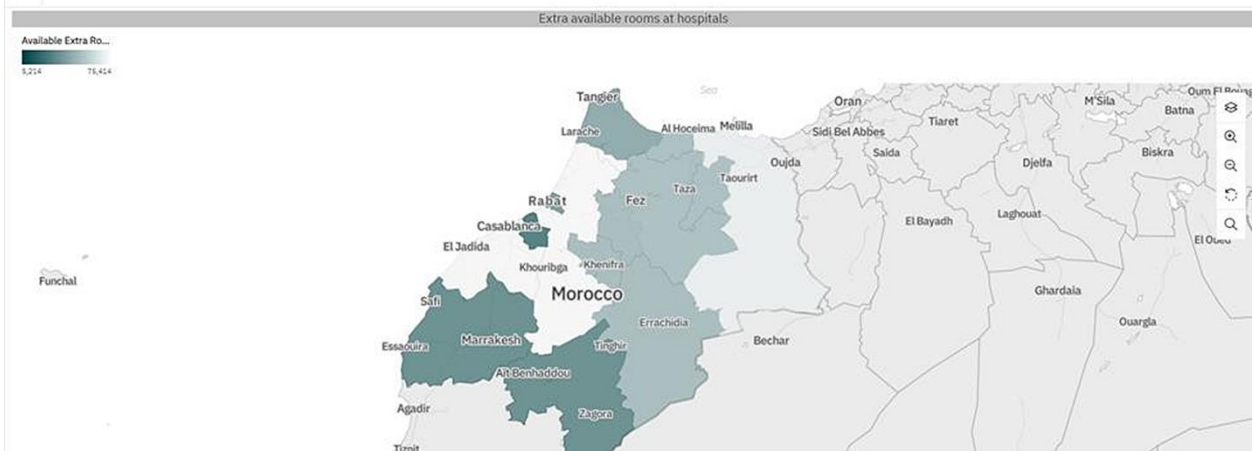

This bar charts depicts the number of patients by their Severity of illness and their Length of stay.

Conclusion

- Based on these, the Length of Stay of Patients is identified. Once identified, beds and resources could be allocated to the departments and wards.
- Patients with high LOS risk can have their treatment plan optimized to minimize LOS and lower the chance of staff/visitor infection.
